INTRODUCTION

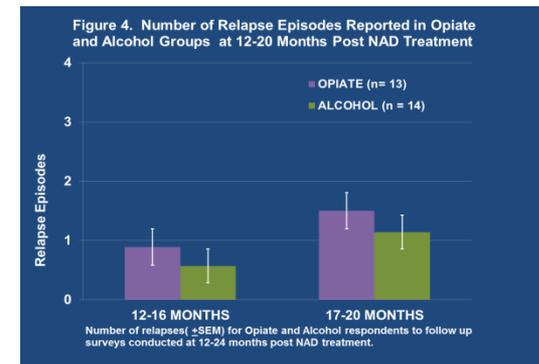

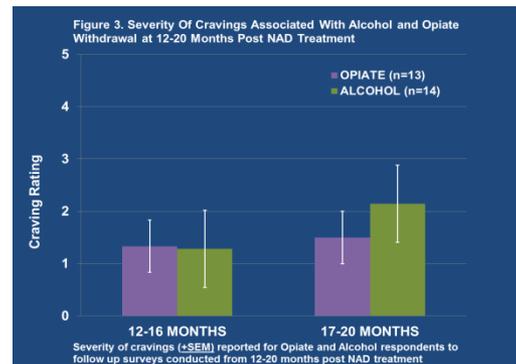

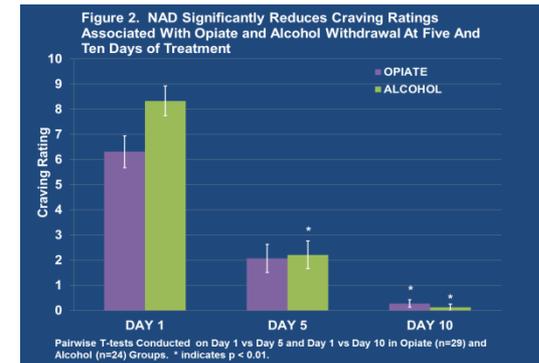

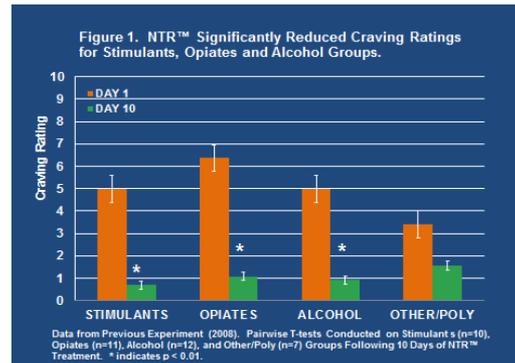

Introduction: Treatment of substance abuse disorders continues to challenge clinicians and “cravings” for the abused substance are often impediments to sobriety. Nicotinamide Adenine Dinucleotide (NAD) has been used in the past with claims of having anti-craving properties. Previous data from this clinic using a similar formulation of NAD support the use of NAD as a valid treatment for drug cravings. ***This pilot study retrospectively examined the anti-craving properties of NAD in a group of 60 patients.***

Additionally, patients were assessed on severity of cravings and relapse episodes at 12-20 months post treatment.

METHOD

The patients were adult males and females with addictions to primarily opiates or alcohol (N=60). Six patients were omitted due to incomplete data. The treatment, Brain Restoration Plus (BR+)TM comprised of IV infusions of NAD as well as vitamins, oral amino acids, NAC and variable PRN medications for an average of 10 consecutive days ranging from 5 to 10 hours daily at a dose range of 500mg-1500mg each day. Self-reported craving ratings (0-10 Scale) were collected on Day 1 (before starting treatment), Day 5, and on Day 10 (last day of treatment). Follow up phone surveys were conducted from 12-20 months post treatment (N= 27). Patients reported severity of cravings (1-5) and number of relapse episodes at the present time.

RESULTS

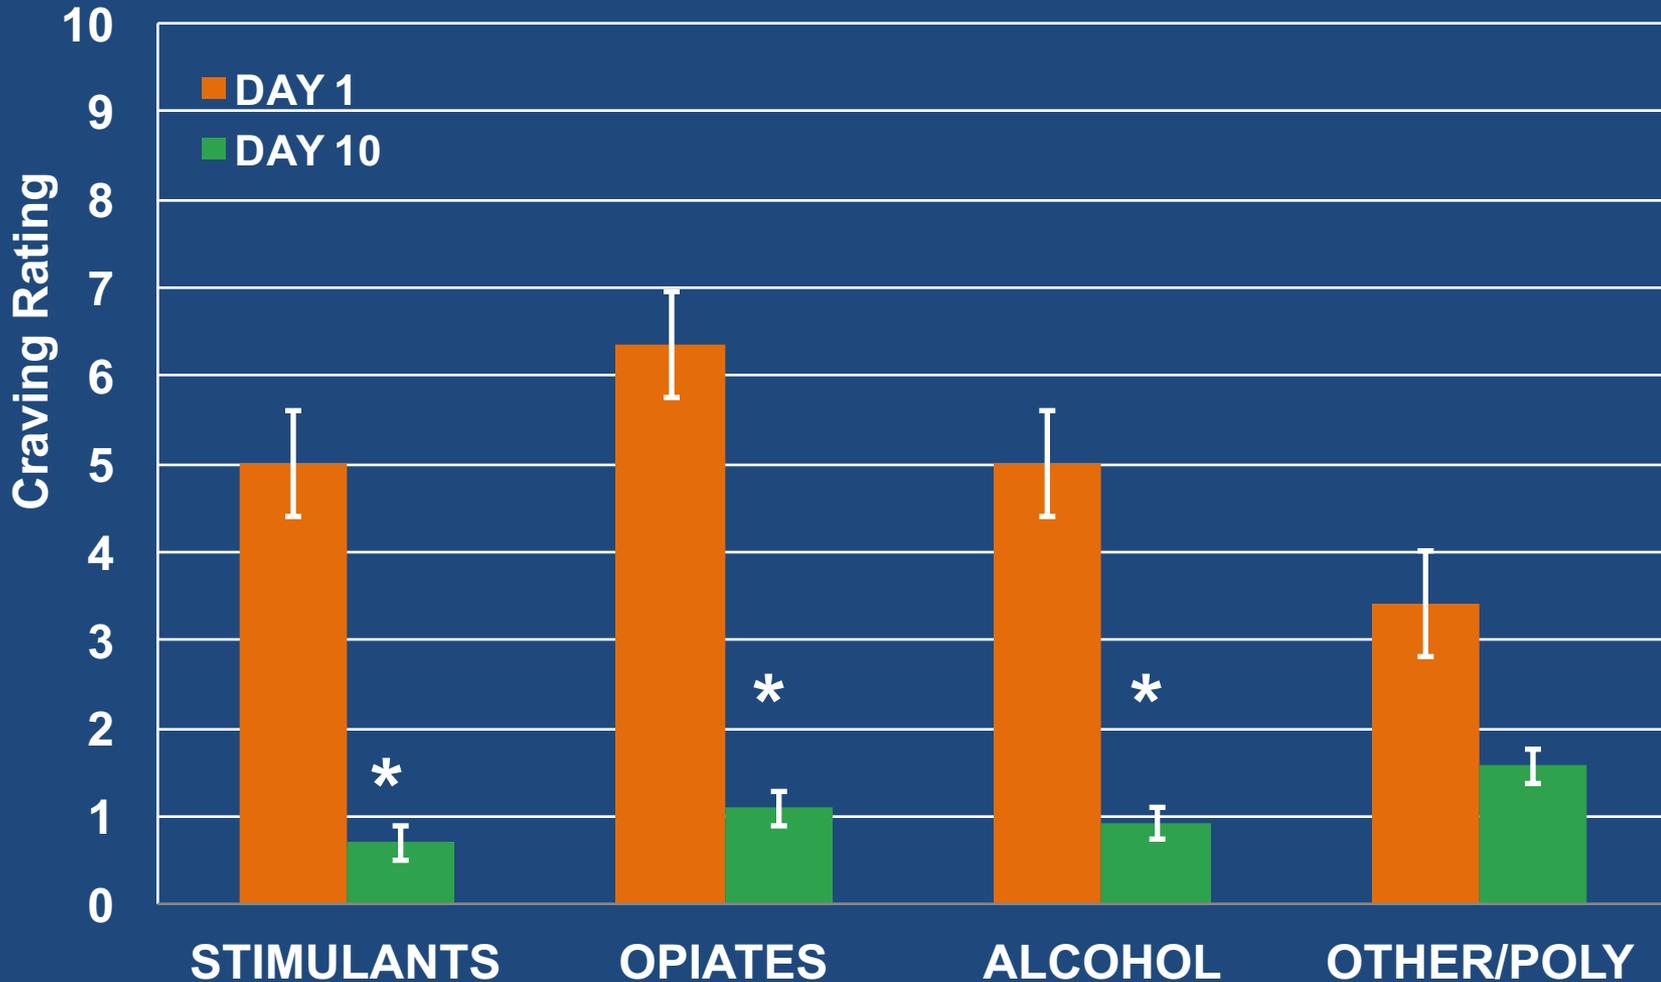

CONCLUSIONS

- 1) NAD is an effective detox treatment for alcohol and opiate addicts as evidenced by a significant reduction in craving ratings.
- 2) NAD was effective in reducing and maintaining the number of relapse episodes, as well as severity of drug cravings.
- 3) NAD shows potential as a long-term therapy in maintaining sobriety through minimizing drug cravings and preventing relapse.

ACKNOWLEDGMENTS

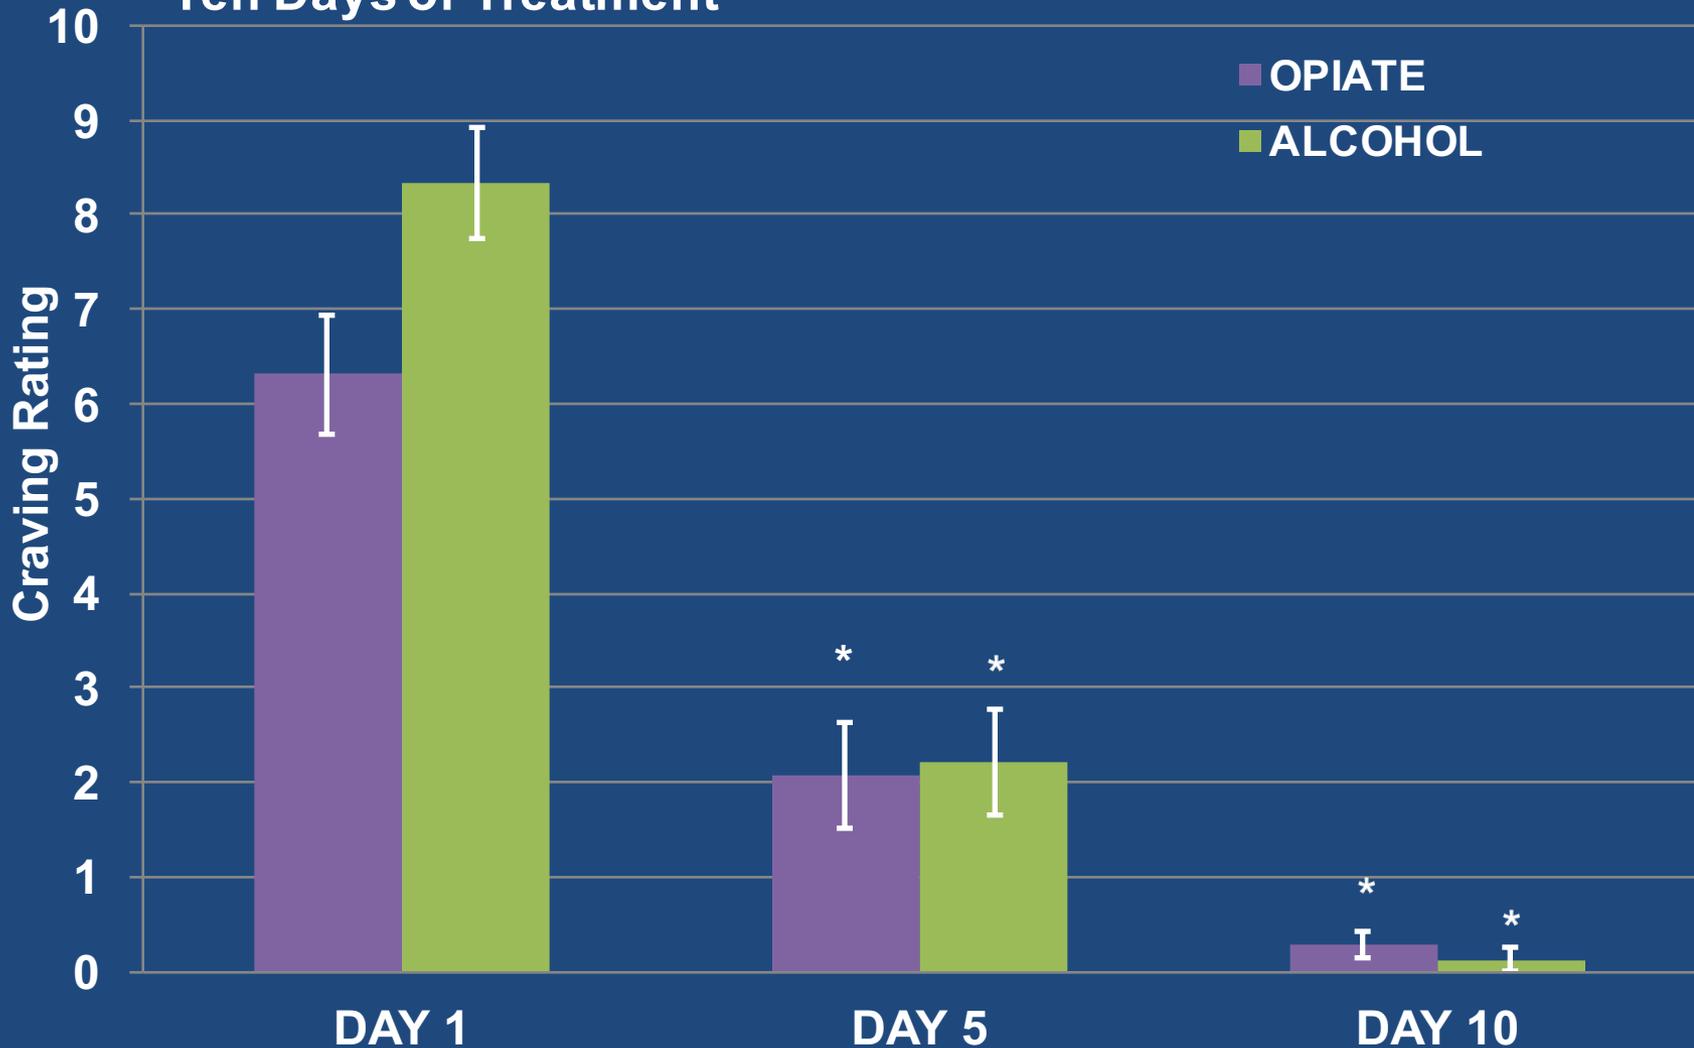

Thank you to Springfield Wellness Center for providing patient data. Thank you to William Carey University for providing a Professional Development Grant in support of this project.

Figure 1. NTR™ Significantly Reduced Craving Ratings for Stimulants, Opiates and Alcohol Groups.

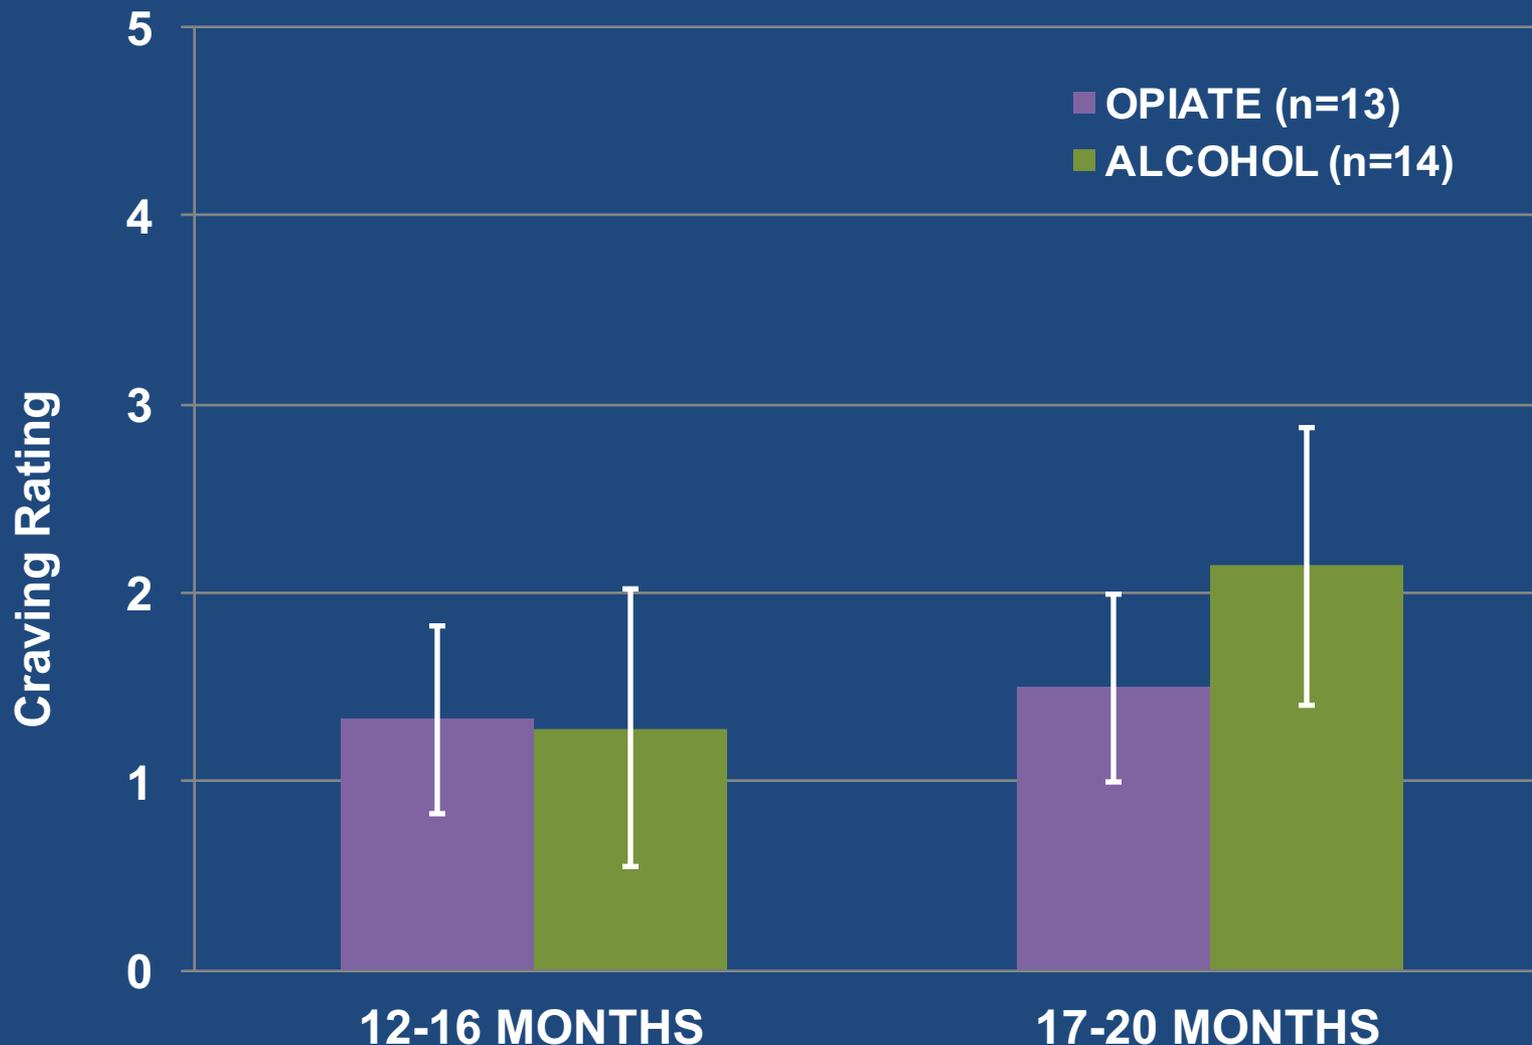

Data from Previous Experiment (2008). Pairwise T-tests Conducted on Stimulants (n=10), Opiates (n=11), Alcohol (n=12), and Other/Poly (n=7) Groups Following 10 Days of NTR™ Treatment. * indicates $p < 0.01$.

Figure 2. NAD Significantly Reduces Craving Ratings Associated With Opiate and Alcohol Withdrawal At Five And Ten Days of Treatment

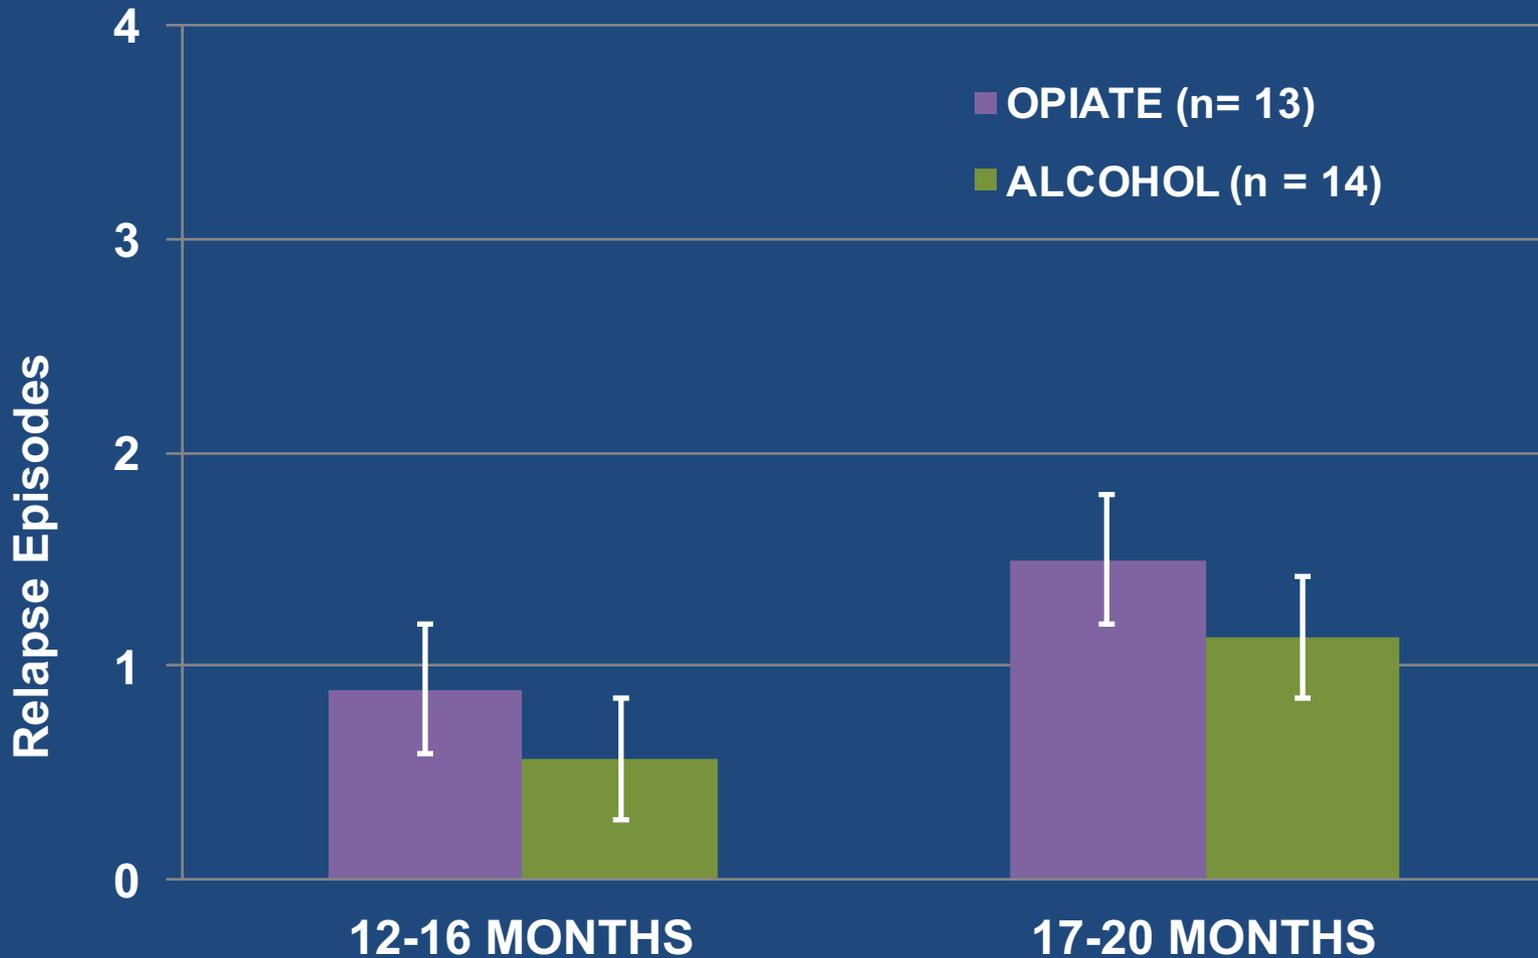

Pairwise T-tests Conducted on Day 1 vs Day 5 and Day 1 vs Day 10 in Opiate (n=29) and Alcohol (n=24) Groups. * indicates $p < 0.01$.

Figure 3. Severity Of Cravings Associated With Alcohol and Opiate Withdrawal at 12-20 Months Post NAD Treatment

Severity of cravings (+SEM) reported for Opiate and Alcohol respondents to follow up surveys conducted from 12-20 months post NAD treatment

Figure 4. Number of Relapse Episodes Reported in Opiate and Alcohol Groups at 12-20 Months Post NAD Treatment

Number of relapses (\pm SEM) for Opiate and Alcohol respondents to follow up surveys conducted at 12-24 months post NAD treatment.
